===== TESTIMONIALS ===== I have used TitlePics to get a handle on the spatial metadata inside DigitalGlobe's MyGlobeTM imagery and have found them to be very useful in that process. The TitlePics do make it easy to generate metadata, read it back from imagery, and get a good visual representation of the metadata. TitlePics provide a nice easy-to-use interface for reading metadata and displaying it in a user-friendly manner. Jeffrey Burch SkyTruth, Inc. "The TitlePic metadata format has made it easy to import geospatial metadata into our software without having to get bogged down with complex and convoluted XML and GDAL. While the TitlePic reader was still in development, I was able to look at the metadata for a high resolution image and load it into our software in under a minute. I really appreciate the ease of use of the TitlePic metadata, and I'm looking forward to our software taking advantage of this amazing technology." George Matros Associate Professor University of Tennessee GIS Department "TitlePics have been very useful to me. They are easier to use than many formats and work with commercial systems. I like the fact that they are made available for free. They provide a powerful tool for getting data into and out of GIS. I am looking forward to a growing number of applications for this format. It is clear that they are headed in the right direction." Doug Humphrey University of North Carolina-Greensboro "TitlePics have been instrumental in making our geospatial metadata accessible and useable for a wide range of projects. We have a client who recently used TitlePics to open GIS data into their GIS software and another client who developed an application to display our data and who uses TitlePics to show GIS data to
