Streaming playback of any song in all videos using the same method that YouTube Vevo uses. Once you have the function in the Vevo player you can play music in any video with this feature. Free DownloadQ: Keras - how to handle variable size of sequences I am currently using a lot of 1D and 2D data in my model. I am using RNN. Most examples I see of using RNN's use fixed length sequences (i.e., none or all the data is of variable length). Is it possible to model variable length sequences in keras? How is this accomplished? I have searched for an example with variable length sequences, but only found one example (which is probably broken). There is an example to draw from where the sequence length is predefined and the model is tested. Here is what I am looking for: # - data: [train, valid, test] # - input size: variable # - sequence: variable # - output size: variable I have found a few examples of variable length sequences but all of them seem to have a fixed sequence length (see examples below). The size of the sequence
