Description: Watery Desktop 3d V3.999.full.rar is lightweight software, but it is complete and packed with a lot of features. Watery Desktop 3d V3.999.full.rar is the best choice. Watery Desktop 3d V3.999.full.rar is a freeware software and it was tested for hidden viruses, spyware, adware, trojan, backdoors and other malicious content. Watery Desktop 3d V3.999.full.rar was reviewed by Softonic and it is absolutely safe to use. Overall : It`s easy to use, a lot of useful and useful features. It`s developed by a famous group of developers and it runs smoothly without any problems. Sincere thanks to you for this software. It is really very useful for me.Q: How to get higher values in SQL (or rather PHP)? I have an SQL query for a Job Posting System. I want to know what values are the best, and under which values are the worst, which field. So the big problem here is that the users only have the choice of two values, great or poor. I want to be able to know which value is the best, and the worst. Table name: JobPosting (JobPostingId (Key), PostReview, PostDate, PostDateValue, JobPostingServiceId) So I need a second table to link the best values, and the worst values. so in the jobposting table I'd put the low number, and in the jobPostingBestValues I'd put the high number. so the sum of each row is like this: (2) and the sum of each field is like this (6) I think this is clear enough, but I'd need it for PHP, and I can't find the right words for the question. A: Well you could do it like this: select PostReview, (PostDate - PostDateValue) as PostSaleTime from JobPosting where PostReview = GREAT group by PostReview, (PostDate - PostDateValue) Or like this: select PostReview, PostDate, PostDateValue, PostDate - PostDateValue as PostSaleTime from JobPosting where PostReview = GREAT
