What-U-Hear Track Recorder Product Key is a software that allows you to record audio tracks on your PC in an effortless manner. It can help you if you want to record audio files to your computer for future reference. The program is compatible with all major operating systems and contains the following main features: Records audio tracks as a series of MP3 files Allows you to choose between many formats and quality profiles A: There is a program that I have found to be excellent for my needs. It is called Audacity. It is very basic but extremely powerful and has many options that are not available with other similar programs. A: Go to the Sound Recorder control panel and make sure "External Audio I/O Devices" is checked. Next go to "Options", then to "Recording" tab, then click the "Audio Track" button. Choose "Enable Recording". You should be able to select what you want to record. Try turning your mic on, then off and recording what you hear. The reason I tell you to do this is to help eliminate background sounds. Q: Avoiding code repetition when developing, I have some bad ideas... I am developing an application that uses image processing in a very specific way. The input is a multilayer image (each layer is a new image), and the output is another multilayer image. I want to avoid code duplication. I have several functions that could work well, but I don't want to copy and paste the same code in several functions, because I want to avoid code duplication. It's difficult to avoid code repetition, because the code is different depending on the input parameters. For example: // input parameters: // layer 0: image // layer 1: image ... image.copy() image2.copy() ... I want to avoid to copy and paste several times. I thought about using inheritance, and creating an abstract base class. I would like to do something like this: // superclass class Image { Image(float[][] input) { ... } } // subclasses class Image_0 : Image { Image_0(float[][] input) : super(input);
